Editorial

HERE we are, just got the new office sorted out and holiday time bearing down on me like a fair few trucks ... literally, indeed, as I am moving house at the end of the week. However, thanks to Arisel and the contents it shouldn't affect this *as* August magazine, fingers crossed, toes crossed.

I need a holiday.

By the way, owing to a paper inverter at Sunshine a few weeks ago, some people who should have done, won't have had their June renewal invoices yet. We have only just found out, and we're working on it.

By coincidence, Roger Merrick's report on his experience with Gordon Trott's hard disc system arrived in time to prove what Paul Gruber is saying in his new column. The power is there for the Dragon if you look for it.

Problems with hard disc fragility are universal and not confined to the Dragon. Ask anybody with a hard disc, and watch their faces!

And new pundits predict that digital tape recording will lead data storage back to cassettes in the longer term.

Readership contains an editorial rant for reviewers, in reply to those who want the secrets of time and fortune.

And the Golden Rule? Meet the deadline ... bye!

How to submit articles

The quality of the material we can publish in Dragon User each month will, to a very great extent, depend on the quality of the observations that you can make with your Dragon. The Dragon computer was launched on to the market with a powerful version of Basic, but with very poor documentation.

Articles which are submitted to Dragon User for publication should not be more than 5000 words long. All submissions should be typed. Please leave wide margins and a double space between each line. Programs should, whenever possible, be computer printed on plain white paper and be accompanied by a tape of the program.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your program translated you must include a stamped addressed envelope.

Letters

This is your chance to air your views — send your tips, compliments and complaints to Letters Page, Dragon User, 49 Alexandra Road, Hounslow, Middle TW5 4RP.

Canoe in trouble

REFERENCE: Canoe, Dragon User July 1988.

May I appeal for help through your columns with the above program, which was quite a lengthy one in machine code?

Unfortunately, the listing was incomplete at address \$H465A. There is a 'JMP \$H4724' instruction but there is no routine at \$H4724 in view of the fact that no corrections appeared in later issues of DU. I can only assume that was the only reader dumb enough to type in such a mass of his code, even if it did take nearly two years to get round to it.

Recent letters to Mr. Craucher requesting a listing of the missing code have failed to produce any response.

However, the article offered to supply tapes of the program. If any readers purchased such tapes and would send me a memory dump running from \$H4724 to \$H497F I would be extremely grateful. Postage would naturally be refunded.

In closing, may I make the observation that I find it distressing that a contributor should apparently take such a cynical attitude when asked to correct an error. Dragon users would be justifiably annoyed at purchasing a faulty program from a software house.

D. Swift
47 Headington Road
Blackobrod
Berkshire SL8 5LA

YES indeed and no indeed; you were certainly not the only person to type it in, as I remember a protracted correspondence with several people concerned after Canoe appeared. I seem to recall that the correspondence had a happy ending, and that Mr. Craucher played no part in it. Apart from that, my memory is shrouded in mist and I cannot for the life of me explain why this case was rather odd, or why no update appeared in DU.

There may have been something in the nature of his having not actually written routine at that location, and the program running

Every month we will be shelling out a game or two, courtesy of our suppliers, to the reader's who send the most interesting or entertaining letters. So send us your hints and your opinions, send us your hi-scores and suggestions. Send us your best Dragon stories. What if you think we are, mind readers?

DOS complexities raised

I would like to comment on some of the issues raised by Rex Smith in the May Dragon User.

Firstly, as SuperDOS 88 appears to be DragonDOS with about half the faults corrected, having a copy of the directory on track 10 is by no means 'safe'. Whenever a sector on track 20 is written, it is copied to track 10 when the motor comes out. This means that directory corruption is also copied, usually before corrective action can be taken. I would contend that user-initiated backup (and recovery?) would be preferable, otherwise no second copy of the directory is required.

Next, SuperDOS 88 does not operate as described when using CLOSE, as the DragonDOS fault is still present. The cure for this, and a method of

single file CLOSE operation, was given by DragonDOS corrections (DU May '88). Also, the idiosyncrasies mentioned at the end of the article are either introduced faults or some of the DragonDOS faults left uncorrected. I note there is no mention of data loss with FWRITE, the corruption by CUP, undeleted errors, erroneous errors etc.

Finally, with a little effort and ingenuity, it is possible to produce a DragonDOS-compatible DOS (I currently run such a DOS) without the errors and with the features Rex Smith would like (SCOPY equivalent, selectable single-track directory, single file close, etc.) and stay well within 88. The remaining space can then be used for additions (user-definable program compatibility, named and numbered discs, etc.)

Philip D Scott, 4 Redgeway Drive, Windy
Canterbury, Surrey GU7 6BP

satisfactorily with a minor bit of tweaking which somebody else worked out or saw at once.

There is nothing in the file. It is a mystery. Can anybody out there help Mr. Swift?

DU expects authors to sort out any bugs which crop up after publication, and in the rare case where we have had a seriously bugged program or very bewildered readers as a result of something we have published, the authors have waded in and sorted out. Unfortunately, in the case of a program which was published two years ago, we have added difficulties: there may be a perfectly in-

nocent explanation for Mr. Craucher's silence; he may be at an age to be away at college or canoeing round the world; he too may have lost and forgotten his own program; or he may be so haunted by the terrible consequences of the missing routine that he has become a hopeless recluse.

On the other hand, if he or one of his mates is reading this, could you drop me a line to let me know? We aren't going to send the Dragon Boot boys round to take the cheque back — honestly.

Tandy response

On your letters page you said you would like to know how Dragon and Tandy owners would feel about you extending your repertoire into Tandy country. I can assure you that most owners would be very pleased. I think that if Dragon and Tandy owners got together a bit more, both machines will be in use a lot longer than they would trying to clarify on intricately. It would also help if software houses catered for both machines a bit more.

RAM on rampage

FOR some while now my Dragon 32 has had an annoying fault. The problem was lack of usable memory. When I bought my Zenith, I could not load the Demo — there was insufficient space. I phoned Gordon Twist, who suggested that I PRINT MEM. This I did and up came 8487 bytes. A top of 64K had occurred. I carried on with the fault for a long time.

Someone at work suggested that it could be a ram chip down, so I got my mate, who is a prototype wireman, to remove the sixteen 416s (my board is an issue 4) and replace them with sockets. He took several lunch hours over the job, but in the end I had all my chips in their original positions. He then touched all the tracks and fitted links where the tracks were damaged.

I took the board home, plugged it in, and turned it on. Sure enough, it worked, but I still had only 8487 of memory. I now took a new 416 and fitted it in each position in turn, ignoring the first two, as the basic goes up there, and the machine just crashes if it can't. At about the third time the end, I plugged the new one in and PRINTED MEM and to my delight up came 24,877. I

checked in my back, and that is indeed the correct figure for a 32K Dragon. (The Basic takes up the remaining 8K).

I have enjoyed Dragon User for some years now, obtaining many useful tips from it and I am very pleased to be able to pass these on to others who may be in the same boat as I was. I was given — in the course of my problems — an issue of Basic II has a sample chip gone, but if anyone can make use of it (I would be pleased to pass it on, for the cost of the postage). Finally has any one out there in Dragon land got the book inside the Dragon, which may be lying around surplus, I would like one in exchange for Basic Vouchers.

Disc hangups

I have been a regular reader of Dragon User for about four years now and have seen the quality of programs and articles improve greatly. If I have a problem I need only look in past issues and usually find the answer so I would like to thank DU, and of course all the companies that have continued to support the Dragon. I have found all the articles on DragonDOS very helpful, particularly Pam O'Any's "Disc Rescue" which provided me from pulling my hair out.

After having run-into trouble with tape recorders, I decided to purchase a second hand disc drive. With the drive came a number of discs with some very good software, but one disc also contained files which I didn't want so I sat about deleting them without including the file type. The result was a corrupted disc.

I then tried saving some of my own programs and got nothing but GURPAP and fix errors. Come back to error, I forgive you! Before I had pulled out too much hair I found the Disc Rescue program and was able to recover all but one program.

I think I have found some errors in the DOS as well as advice published in your magazine, which other Dragon DOS

users should know about. If DRAGON is used in command mode the computer sometimes hangs up. If a file is KILLED and a new file of the same name is saved, I sometimes get a RFP error. One occasion the computer hung up and corrupted the disc. On some discs the first file in the directory is corrupted when loaded.

Finally, one of my new discs developed a CG error on one file and an PF error on another where a file which was corrupted loaded alright. All this happened in the space of five minutes when I left the room and returned.

Basic09 print alarm

THANKS for printing my article Basic09. Due to the rather faint reproduction, you probably the vagaries of my printer. I think it would be helpful if you printed following.

Basic09 (June 1988) contained a simple program as an example of what can be done if anyone had a got at using it, they should be warned that the

underscore which connects 'printer_path' did not reproduce clearly. In C&G, variable names can be pretty long, but no spaces can be left in them.

Perhaps this short note will prevent a few suicides.

Also in the first column of the article, the instruction 'TandyTerm' should look like 'TandyTerm' — the space is essential.

Best wishes to you and DU under the new management.

David Hootby
1 Heath Road
Glossop
Derbyshire
S10 2BY

THANKS, David. Your listing was quite alright, apart from being abridged, and although we always ask the printers to make the listings as contested as possible in that case, still very fine details, like the tails on commas, tend to bleach out.

In fact, the underscores do show in 80% of the lines, but it is possible that they could be overlooked and your warning is timely.

Hope that the underscores in your letter above is reproduced correctly — but owing to the vagaries of typesetting, underscores frequently get lost, an annoyance to people who write about languages like 08-08 or QL SuperBasic. It did get lost, we had to put it in specially.

Dragons A1 service

A few years ago when it became something of an inconvenience to share my BBC with my son, we decided to purchase a computer for him. At that point there was a particularly good sale offer at Dixons on the Dragon and, as an excellent job had been done by help the engineering future of Dragon Data, we were obviously not made aware of the problems in store, and went ahead with the purchase.

As it turned out, the problems were not so disastrous after all, but thanks almost solely to Dragon Data, we subscribed to it immediately, which was to become our lifeline and, had it not been

for Dragon User, we would have changed to another computer ages ago. The main problem, of course, was the lack of suppliers for both software and hardware. It was a long time before we realised that by far the easiest way to get software and hardware was by mail order from people advertising in DU. After purchasing the initial games, etc. we decided to add a word processor and this was followed some time later with equivalent byte rate drives.

Since my son (like his elder brother — a school programmer) was interested in computers as a career, about 18 months ago we decided to extend his facilities by having an upgrade from 32 to 64. For this we contacted Compuserve. They did a first class job and, considering it was close to Christmas, is very good value.

My son will be 18 in April and we agreed to purchase a monitor for his birthday, as he had been using his television until then. I thought at first that it might be more convenient to buy one locally and avoid the necessity of delivery contact, as to be expected, when I approached the computer shops in Leicester, they did not want to know about the Dragon, with remarks like "Can't get you anything for the Dragon". There isn't one for the Dragon! and all the rest. I should have known better by now so I went back to the faithful Compuserve with dramatic results.

I phoned them on Monday March 28th to check their prices and availability and this gave me my first surprise. They said they would have to order one as they did not actually stock them and the price they quoted was exactly the same as twelve months previously.

I put a cheque in the post on Tuesday March 29th and the monitor was delivered to my door at lunch time (Thursday March 30th). The monitor came direct from the manufacturers and the cable came from Compuserve. The cable arrived on Friday March 31st. This has to be the most efficient service I have ever experienced and I felt I simply had to write to tell you. If the pathetic British postal service ever goes public I pray it is someone like Compuserve that takes over.

Diamonds and ghosts

DRAGONWARE Services have launched a bouquet of new games in the £2 to £3 price bracket.

The new titles are *Diamond Master* (DMSB), in which the challenge is to steal the Black Diamond from its owner's house, *Simon Ghost* (DSGB), in which you must borrow diving equipment and a boat and set out to find gold, silver and platinum in a haunted wreck, *Must Cut* (CDBS), an 100% machine code version of the classic *Beetle Cut*, with variable but not full speeds and stars, colors, music and a two player option, *Dragonfire* (DSDB), an educational game for over-16s learning maths, history and biology, with an optional philosophy of *Right Pack* for the under-16s on the back if requested, and *Ghost-Sketch*

(GSDS), a line-art drawing aid for users of the Tandy Electronic Book on the Dragon 32 or 64.

For details, post and packing costs and up-to-date price list, send a SAE to Dragonfire Services, 12 Perry Jones Close, Baines, Gwent NP23 3BH.

Two pulses

PULSER Software's major releases of recent months, *Flashy*, an 1704-plus game on DragonDOS disc only, and *Jonathan Cartwright's Gloop*, an air-attack/shooting game with detailed black and white graphics on cassette, are now both available, priced £27.99 and £14.99 respectively.

Enquiries to Pulser Software, 35 Foxhall, High Compton, Stroud, Glos GL2 7WJ.

Orange appeal

ORANGE Software now have the licence to distribute DOS Plus but Phil Scott (not to be confused with Phil Scott — JCL) for DragonDOS, and its variant DOS Plus Delta, which allows the user to choose between DragonDOS and DeltaDOS either via a small hardware switch now available from Phil Scott himself, or by loading.

Orange are also releasing the 16th adventure from Simon Hargrave, *Snake Island* priced at £5.00. It is likely, says Orange's Graham Smith, that they will run a special offer on the whole set of Hargrave adventures in due course.

Another new adventure from Orange is *War Hammer* of Gibran, a long, alternative choice

style adventure on two discs. A price has yet to be established. "This is a very long, but fairly straightforward" says Graham. "As it may appeal to arcade buffs as well as adventure players." He draws a parallel with the popular adventure games where the outcome is decided by the player's choice of actions, rather than by the solving of riddles.

Tandy conversions of *Dean Stalker* and *Locher's Kingdom* are also available.

Information sheets from Orange Software, The Girth, Star Road, Hatt-y-Derry, Aber-garnny, Gwent NP23 6DP. Tel: 02923 0214 66.

Reviewers rule OK

YOUR editor has had one or two queries recently about reviewing for Dragon User so this is his goodnight to us through the guidelines again.

Whether or not present day Dragon users remember the days (not very long ago) when 90% of Dragon games were reviewed by Jason Graham, some felt remain under the illusion that only a selected site is allowed to review for DU.

This is not true. It could be you.

All you need to do, to become a Dragon User reviewer is write a review which Dragon User decides, in its wisdom, to print, with your byline at its foot.

How do you go about this?

Observe carefully the style in which Dragon User reviews are written as much as possible as far as possible gleaned from a reasonably prolonged playing of the game. Good and bad features pointed out. An assessment of playability, value for money and appearance.

Always, include details of the supplier and the price at the top. Allocate between one and five Dragons, and explain why if you wish. Handwritten copy is acceptable for reviews, but please bear in mind that somebody has to type it.

Acceptable for reviews, but please bear in mind that somebody has to type it.

No fixed rule

We don't set any limit on length, expect your reviewer to cut if necessary. Very long reviews are more likely to be ignored than short ones, but there is no fixed rule. However, a dozen lines quoting literally from the review is not acceptable. This game has great graphics and great sound and I think it is great." is unlikely to make an appearance — we want to know what you actually experience when you play the game.

What should you NOT do to become a Dragon User reviewer?

Well, you shouldn't write to the Editor and ask to be sent software to review. Send your own reviews. If they are consistently good, and we print them, then one day, when you least expect it, a small dirty bag will appear on your doorstep enclosing the legend "Please will you review this, and as

quickly as possible? If you don't want to, send it back, also as quickly as possible."

Surprise, surprise, we don't often get them sent back, although the reviewer's initials will know software author to reviewer rather specialised program, only to discover that it was a direct competitor to one of their own.

Embarrassment, embarrassment.

If you don't review something that is sent to you, and you don't send it back, you don't get asked again.

Nobody is authorised by this magazine to write a publisher saying that they are a Dragon User reviewer and asking for complimentary software. It is, of course, a free world, but complimentary review copies are sent out by the editor's opinion, and only reviews commissioned by the editor have a guarantee of publication.

On the other hand, everybody knows that Dragon User often publishes more than one review of a new program, and it is up to suppliers to decide to whom they wish to allocate review copies on their own account.

If it fits

Why have you published so much on Orange Software recently? People ask. Because they are a new company with a new expanding list that Dragon User has not previously covered. All the ideas that I'll print, remember. Anotherly write and tell us what they are up to, without which, we wouldn't know, would we? It only takes ten minutes and a stamp to let the Newsletter know what your new products and special offers are, so don't delay, write today, and don't forget to let us have a copy of anything you want reviewed.

Reviewing for Dragon User is not, contrary to occasional opinion, a way to build a large free software collection. There is a limited amount to go round, it is shared out according to the magazine's requirements, and the editor's decision is final. It may come as a surprise to many readers that over half the reviews published, on average, including those from "regular" reviewers, derive from programs brought by little reviewers for themselves.

Indeed, it is generally true that without the enthusiasm to collect and refine one's critical judgement simply for the love of it, a person will never acquire the knowledge and conviction which leads to regular publication in a particular field.

© 2000 Blackwell Science Ltd *Journal of Internal Medicine* 247: 399–406

One to three and climbing

Program: *Destiny* (two disc version)
Supplier: Futur Software, 26 Pochell, High Complex, Esher, Surrey GU27 7HQ
Price: £3.99 the set

WELL, you adventure players, here is a three-in-one disc for you to savour. The first item is *Starship Destiny*, a multi-type adventure. The location of the 'main' is an alien spaceship which has entered the galaxy and seems to be lost to destiny/thereabouts. The object of the game is to disarm the alien machine and to get out alive. The game comes with the player being teleported into a cargo bay in the alien ship. As the adventure is played in real time, after you have disarmed the missile you must teleport home, as if you are participating in a relay race. A patrol will arrive you and dump you in confinement. You can of course escape if you have the keys, otherwise you are stuck. If this happens and you cannot think of a solution you may as well abort the game and start again (have you tried standing on a desert? — Ed).

Having described the game I found it a little frustrating because, despite being told that the game is in real time, the screen images took too long for my personal taste to disappear and re-appear, and are slow to get on or see through my anticipated solution. The wait seemed intolerable, although in actual fact it is only seconds.

The overall impression of this adventure is one of a good game but lacking polish. It would be improved if it was quieter and quieter, as the pressing of the enter button continually increases the sense of waiting for the game. The screen display would have been enhanced if changes in colour had been introduced. The black, yellow and white areas give every appearance of being dirty, although the game is not.

The second game, *Dungeon Destiny*, devised by Tim Hely and written by Jonathan Galloway, is a distinct improvement on *Starship Destiny*. It is still an adventure maze but the graphics are far superior and

the adventure itself also compares very favourably, although the instructions had to be input in the lower case, which for me detracted from the display. Any attempt to press the shift key resulted in a negative response from the computer. 'You can't ... that here' seemed a frequent response, and the continuing display of 'What now, in brilliant one?' grated after several repetitions, like most forms of 'no' which are only funny if they come as a surprise.

Notwithstanding these minor criticisms, I nevertheless thoroughly enjoyed the adventure, and if I had only £3.99 to spend I would choose this one rather than *Destiny*.

The third game is *Millenium Destiny* which for me was the best. However, when I first tried the disc I thought that it had corrupted, because inside the minute of loading without success, the screen display told me not to remove the disc, and nothing seemed to happen. I tried again with sword, and the computer played a tune for

almost 30 seconds before it actually loaded — however, one criticism of the earlier games was overcome: it did auto run. Once commencing the game I found that I had been killed in about six moves but without warning, but at least I gave me another game immediately into the second game after trying the usual commands like enter, think, etc., for reasons showed tried Help, which told me, among other things, to be prepared for anything and one certainty must. The second game lasted longer — just if you enjoy your frustration, this game is definitely for you.

Overall I enjoyed this disc and in terms of hours at the keyboard it is very good value. Each of the three games is better than the one before, another development of the programs can be clearly seen. For those who specialise in adventures, this may be a bit tedious, but for all-rounders it is certainly worth a try.

Roland Harrison

A word could tell a thousand pictures

Program: *Picture Maker*
Supplier: John Fern Software
Price: £5

I was asked to take another look at *Picture Maker* after Gordon Lee complained that the instructions were difficult to find and use. Well, unfortunately for David Main, the author, I must concur with Gordon. Lee on many points. The instructions, which are the only problem, are on two sheets of A4 paper in 14-point type, so in order to make things a little easier for myself I ran the instructions from the program (where they are available) through my printer and received the same information, minus the screen dump routine.

The whole object of these instructions is to allow the absolute beginner to understand them, carry out the necessary commands and produce the object for the activity (Penton,

Revised 77). The problem inherent in *Picture Maker* is that the program is extremely sophisticated, and the instructions do not give a working example with which to practice. Unless one is there to provide the ordinary computer user with a facility that he can make use of fully visually and *Picture Maker* constantly reinforces this. The two pages of instructions, although elaborated, are not comprehensive nor easily read. There have been other utility programs in the past for creating graphic screen displays; one that springs to mind is *Graphic Memory* by R R Smith, which can be run on Prodos 2.0, 2.4, and is less sophisticated than *Picture Maker*. *Picture Maker* comes complete with a fourteen-page instruction booklet written in single, easy to follow routines, that are logical and sequential. Plus! *Picture Maker* can also be used to create

and edit graphics, shapes, in modes 3 and 4, contains the equivalent of five pages of line Art and technical writers, complete with an example.

It would appear that David has put a very great deal into *Picture Maker* but it cannot be accessed and used to its full because of his assumption that the user will find it easy to follow, which is not the case.

However, I was impressed with the functions of the program itself. The ability to move areas about, to delete and replace, and indeed even to stretch stored areas horizontally or vertically is all there. Alterations are automatically re-numbered, and you can store up to eight different areas at a time depending on their size, which needs to be remembered when attempting to stretch an area, because obviously if the resulting area is

then too large or of a height area has been used, there will be insufficient room and the program will ignore the function.

A most impressive command is the M for magnify, which magnifies the area under the cursor position on the normal viewing screen to a magnified version on a different screen. The size of the area magnified (not the magnification itself) can then be enlarged by a simple key depression, and colour change too set at the touch of the keyboard. The magnification screen is then updated even when not in use, which allows the speed of movement to be controlled. To couple all these functions to a true 'picture maker' which will draw lines, colour in a foreground colour from the cursor position or a border in the background

Continued on page 11

DRAGONSWORD!

Paul Grade takes a monthly stab at setting the world to rights

On the 20th of last month I received a letter from *User in Charge* informing me that the next deadline was the 20th of the month, and so I might as well be in the middle of trying to deliver a couple of dozen letters, again on overworked photocopiers, and get the DRUG newsletter ready at the time, it didn't really seem like a practical proposition to me, hence the delay. (I was only teasing, Paul — sorry about the camera.) Of course, it hasn't a clue what I'm supposed to be writing about. Reviewers can review, technical writers be technical, and Editors can write Editorial Comments, but what does that leave for me? Usually I only write for updates, when makes the problem worse because it's my own publication and I can say what I like without the risk of anything getting out of my little brain.

It would be nice to be able to fit pages with details of all the new lines, nothing to support the Dragon, with reports on all the newest hardware and software releases, but they would have to be very small pages and I'd have to use very large type.

Yes, I know Dragon Data did a lovely job of marketing the machine, and a lot of software companies imagined that people would pay silly prices for rubbish, but that is only a contributory cause of *The Decline and Fall of the Dragon*. The real reason was, and still is, that for too many computer owners are dedicated followers of fashion. You don't believe me? How many former Dragon owners do you know who have switched to other machines? A couple of years ago they were all singing the Dragon in favour of the BBC, a little later it was the Master or the Amiga, and currently it's Amstrad, ST, or one of the cheaper PC clones, right? Now for the trick part of the question: how many of those who changed machines had actually taken the trouble to learn to use the one they already had? Of the ones that I know, less than 1% had a genuine reason to change. They merely hadn't been managed to find a use for the memory available on the Dragon, but they were sure that they 'needed' at least 640K of ram, and I'll assure you well ahead the old excuse about needing a 'better machine for business', usually from people whose accounting begins and ends with reading their Access statements.

If they needed more memory there was no reason why they couldn't use the space available on disc; after all, that's exactly what most of the 'business' systems do, there's no need to have several meg of program resident in casual the time. I admit that there are exceptions, and that some people have taken the Dragon to its limits and found it still doesn't give them what they need, and in these cases a change is justified, but they are a small minority.

So what does all this have to do with you? Quite a lot, because you subscribe to *Dragon User*, and the reason that I have personally decided that *DU* had to give was that subscriptions had dropped to a figure

that was too low for them to pay their central London company expenses for the magazine. Now, Bob Harris writes and markets good Dragon software, and is taking over *DU* he is acting in self defence as much as anything else. If the Dragon market gets any smaller it will just not be practical for Bob or anyone else to produce software for it.

Before your mind starts to roam on where you, with your plastic money melting in your sticky little paw, try thinking. This is quite a simple process, and although it can waste some discretion there is no actual danger, not even a Government Health Warning, so it isn't likely to do any lasting harm. Try thinking about why you have a computer, what you need it for, and what advantages there are, if any, in spending a medium-sized fortune on changing to a different machine. There isn't much that a Dragon can't do that other machines can, and do you really need ST graphics when you haven't even managed to draw a picture with the machine you have? Do you really need a version of Lotus 1-2-3? Do you really want an expensive, virus ridden lump of plastic that's a nightmare to program, runs commercial software that needs a second mortgage to buy, and operates on MS-DOS and CP/M, both antiquated when the Dragon as first invented?

Before the point, are you really so anxious to admit that you can't even learn to program one of the latest machines ever made? That keeping your sweat-soaked shirt in the 'Jewelry' is more important than sticking with a machine that can do what you need?

OK, don't get the underworld twisted, I know I'm breaking the rules by introducing the punster, but look at it from my point of view for a moment. Four years ago I started the DRUG, and as I've currently got around a thousand members, Dragon *User* has been around even longer, and on a good day has about three times that number of subscribers, and the 'total' Dragon user group can just about make up another 200 between them. Some of our suppliers have existing lists stretching back years, but how many people on those lists are actually buying software?

You don't need a computer (do you?) to work out that this doesn't really add up to more than five thousand Dragons actually up and kicking. Total UK sales of Dragon computers were very close to six figures, and even allowing for natural wastage (Dragons which were burnt out, blown up, sat on, or whatever) that still leaves a lot of machines unaccounted for, doesn't it? Some are probably owned by 'rugged individuals', types who don't need groups or magazines (lets face it, generally imagined according to my knowledge of rugged individuals — *heh*) but what happened to the rest? Are they all being used as door-steps or to prop up the bed? My guess is that most of them were con-

signed to Africa and Capetown because the owners either got tired of using single Commodore centers for clearing them, or felt that they simply had to have the latest in over-advertised status symbols.

It has to be said that there is a lot to say that you could do to give the Dragon a boost. Most of the older machines sit on one of two points, ridiculously large memory and/or good (if expensive) software. Sure there's the usual 'type', but that's increasingly very important. Now there's not a lot you can do about boosting the Dragon's RAM space, it can be fitted up to 640K without too much trouble, but that isn't going to persuade the types who relegated their Dragons to attic where they bought the ST to get it down again. However, if there was more software available (and advertised) which could get the Dragon ahead of the current machines I think you'd find a lot of Dragons coming back out of the woodwork. Programmers aren't some peculiar beast, some of them are (let's call them specially bred by the Atari Corporation, most others are people like you, they could be you).

You don't need to be any particular age or sex, or even some kind of genius, in fact it's probably better if you aren't a school kid, computers are very simple minded machines, and they don't always take a lot to 'bitten clever' programmers.

I get tired of answering the same old letters which mean about lack of software, lack of support, etc. Anyone owning a machine is capable of learning to write good software on it, and those with Dragons have a big advantage over most others in that they have an affordable 'programmer's machine' ever produced, so why are you reading this instead of writing programs? Of course, it isn't only the software side that things could be done to make the poor old beast look more attractive to the fashion followers. One of the current issues is for frame grabbers to be written. They aren't difficult to make, and even old beeps like the old Commodore 64 had them available, so why doesn't someone design one which is not dedicated to a particular machine, one which could be used with the Dragon and other machines with change of software? I know that a lot of Dragon owners are good electronics engineers, some of them even owning their own companies, so why don't they help themselves and the Dragon by giving it a try? The Dragon's strong point is, that it does not require 'dedicated' peripherals, it can run any make of printer or disc drive or tape recorder, it isn't a 'fussy' machine at all, so what's wrong with a 'universal' design which only needs different driver software to adapt it to several machines? That would make the Dragon a serious rival to most of the current machines, with the added advantage of being a lot cheaper! OK, and at last, but why not give it a try?

Paul

64K in two 32K pages

PD Smith consults Motorola about the real SAM

I have written this article to complete the information on the 68000, 68010 (68000) sam chip given by Matthew Lodge in the August '87 issue of Dragon User. In his article Mr. Lodge says that he doesn't know what the sam register \$HFF04 and \$HFF05 does. I have just received the 68000 data sheet from Motorola and this clarifies the use of this register.

The register (referred to as above) you to use the 68K sam in a 68000 computer (such as Dragon 486) as two separate 32K pages addressed from \$0000 to \$FFFF. In fact what happens is that, in map type 0 (PCMA at \$0000-\$FFFF) the 4th bit of the sam address is replaced by the 'P' bit from the sam. This means that if 'P' is reset (zero) then any access to the sam will access the obvious byte. For instance if you access byte 10000, you will use byte 10000 of the sam. However if 'P' is set (equal to one) then any access to the sam will access the byte in the second 32K page. In accessing byte 10000 will in fact use byte 42968 (10000 + 32768). This is really quite difficult to explain and is best understood by some experimentation.

'P' is altered by accessing sam register P1, as can be seen from table one. To select 'P' you must POKE address \$HFF05 with any value. To reset 'P' you must POKE address \$HFF04 with any value.

Check the mode

There are several things to note about this 1/2 page mode. It can only work from the map type 0, that is, the 32K mode of a Dragon 486. In the page mode will only work if you have 64K in your computer. If you only have 32K the 'P' bit will have no effect as the 4th bit of the address is not used. If you set the 'P' bit without preparation the computer will immediately crash (as some of you will have found out by now). This is because the computer will still be generating interrupts which use sam based vectors, and the Basic interpreter uses vectors in ram. Because these vectors have suddenly disappeared the computer will immediately crash.

The first program is the answer to the problem of the computer crashing. This copies the whole of ram into the second ram page, so that when the pages are swapped, Basic will continue as if nothing has happened. Note that the contents of \$HFF00 to \$FFFF cannot be copied into \$HFF00 to \$FFFF as these latter addresses are reallocated by the sam to IO, the sam and the interrupt vectors. However location \$HFF00 to \$HFF0F can be used and you are in the next page if memory.

Before you run **Testing one** you must have set the top of memory to less than \$HFF00, otherwise the system will crash and the computer will crash. To reset the page system you must now set the 'P' bit by POKE \$HFF05.

10 POKE $HFF05,0
20 GOTO 20

```

The computer will now appear to have crashed, but if you try a sound command such as SOUND 1,7 you will hear a beep showing that the computer is still working.

The reason that nothing appears on the screen is that the sam is still displaying 1004-1030 on the screen, while Basic is writing to 32768-34327 (but still thinks that it is writing to 1004-1030). In theory this problem can be solved by telling sam to display the correct addresses, by setting

P1 (see table one). This will work but not for very long, as Basic will instantly reset it when the next character is to be printed.

To see that it can be done, try typing in Basic **Testing two**. This will have to be done blind, but it is short enough to be done. When you run this, you will see all the text that you have entered in your panic when you thought the computer had crashed. Now if you press **END** the computer will redisplay 1004-1030. (A useful note here: Dream does not reset the text screen when it is run (at least mine doesn't) so Dream can be easily used in this mode.)

If you now reset the 'P' bit by POKE \$HFF05 you will see that the screen is working again. Also note that program two

Even though I have found out about this paging function of the sam, I cannot think of any uses for it, but maybe someone using a Dragon was thinking "I wish I could use the SAP as two pages of 32K instead of having to go to map type 1 (SAP mode). Well, now you can.

The real advantage of this paging mode will be apparent if you can program apams and so have a 32K program in apam and have 64K of ram as well. In this case you have 96K of memory from a computer which should only allow 64K. You could also use a static ram in place of an apam (either in place of the second Basic system from a Dragon 64, or in a cartridge).

Beware speed pokes

To finish I will give a comment about the speed-up pokes for the Dragon. Matthew Lodge, in his article about the sam, says that there are four speed modes given by the sam. In fact there are only three. The two he refers to as 'superfast' and 'turbocharged' are identical, with a clock speed of the crystal frequency divided by 8, ie 1.79 MHz. You should only use these 'speed pokes' if the 68008 microprocessor in your Dragon is capable of a clock speed of 1.79 MHz.

The actual microprocessor in the Dragon is the 68008, which has a maximum speed of 1 MHz. There are two enhanced versions available, the 68A008 and the 68B008 which allow clock speeds of 1.8 MHz and 2.0 MHz respectively. (The 'A' after 68008 means that the 68008 uses an external rather than an internal oscillator). This means that to run at speeds of 1.79 MHz you should really use a 68B008. The 68008 should also be replaced by 68B08 otherwise you could damage them by using them at the higher speeds. The reason that some Dragons will work satisfactorily at the higher speeds is because of manufacturing tend to under-rate their products, so that a 6808 may work at 1.8 MHz, but is not under guarantee if used above its specifications.

has vanished. If you set P again, Listing 2 will be back.

Now the main problem is caused by the BASIC PRINT routine resetting the test screen. Listing 3 solves this by intercepting the PRINT command and making out the 'RESET VIDEO' routine. The graphics screen will still be incorrectly displayed, but this can be corrected by setting PB manually as Basic does not reset this.

An important point can be seen from Listing 3. If you have written a program to swap between the sam pages, then the program will have to exist in identical positions in both pages. This is so that the program does not vanish when the pages are changed. Alas, that since the memory is changed, you cannot pass variables on the stack (or in any other portion of memory) between the two pages. The only way to pass variables between the pages is to save the variable into a 6809 register and then swap pages.

Listing 3a

Continued from page 8

colour or conversely, all of which is automatically saved to another screen and can then be dumped using a screen dump routine at the end, is quite an achievement.

Ingepex's experimenting with this program, but referring to my earlier comments I do believe that David should present his instructions in an expanded and more readable manner, perhaps in the form of a booklet using what he has already written with a couple of working examples that the user can follow and then change of experiment with. In this way I feel sure that this excellent program will be enjoyed rather than attempted and put away. One cannot tell a book by its cover and in this case the 'cover' detracts from the real story.

R. L. A. Newton

Beware of the Aardvark

Program: Mandragore
Supplier: Kluge Software, 94 The Oval, Park Park, Sheffield S6 4DP
Price: £3 including p&p

KOUDIA Software is a new name but the man behind the Dragon's latest entry into the

market, John Foster, has been involved with the Dragon for a long time. After his efforts to set up Elera Design, he has set himself up as Kluge Software and is working on games for several computers, including the Dragon.

In Kluge's 'fantastical, mind-boggling' you play the part of a mandragora — a highly advanced experimental robot. During an ancient investigation of an ancient pyramid, you inadvertently trigger the pyramid's self-defence system. You must battle your way through five levels of zombies, ghosts, trapped vegies, laser-fingants and large mutant aardvarks. (How can you tell if an aardvark is a mutant? — Ed.) There are also several turrets and tiny pellets which you must avoid in your attempts to escape from the pyramid.

You must also beware of the enemies who catch over you as you progress further along the pyramid.

At the end of each floor, should you reach it, you must battle with one of the enemies to the death. Should you manage to destroy it, you must fall down the hole to the next floor where your mission will continue. As all there are five floors on level one. On completing the fifth floor, you will ascend to level two, which has the added complication of rogue bullets flying about.

After a dramatic loading screen, a short burst of music will be played. When it comes to an end, a message to press a

key will be displayed and upon doing so the game will start.

Control of the Mandragora is by joystick only, and it takes time to master it fully. The surface of the pyramid is displayed in 3D and is a rather very difficult to judge whether or not you are on the same level as one of the numerous obstacles.

You must learn how to move just one time (by tapping up or down on the joystick) and so means it is as easy as it may sound. This mastering of the robot's movement is essential if you are to be successful.

The first level is particularly difficult if you are careful. On this screen you must contend with the aardvarks, who fire at you, zombies, who are at you, and numerous turrets which must be avoided.

A score is achieved each time you manage to turn an aardvark into a skeleton by firing at it or when you destroy one of many turrets.

The ultimate battle comes at the end of each floor. Here you must destroy one of the enemies which appear in the wall. This requires quick thinking and an even quicker hand.

After dropping down the hole into each of the four floors, you continue to the next floor.

Level two is a totally different level of difficulty. Here, as well as the aardvarks, zombies and pyramids, there are eagles, ants and other nasties.

Mandragore is not a terribly difficult game to start with unless you progress, lives start to vanish very quickly. One good point about the game, though, is that when you are killed, you continue where you left off.

In all you have five lives and while this may seem a lot, it's surprising how quickly they disappear.

The graphics are in 3D (for the most part) and are breathtaking. Never before have I seen a game achieve graphics at the standard of Mandragore (Phone the Guinness Book of Records, quiet.) They really have to be seen to be believed. As you progress further, they get better.

The screen is displayed in MODEX-SCREEN 1.6 graphics. Perhaps MODEX-SCREEN 1.1 graphics would have achieved a better degree of sharpness. As it stands, though, the screen contents are still a marvel.

Technic is well written and the sound accompanying the game is at the highest standard. It is a pity that I have no prize for this masterpiece. It is also a very challenging game which should challenge hardened arcade fanatics to the limit. I can say with hard on game, that rarely will you find a game as good as this one for under £3.00.

Conrad Blackwell

Imperfect world is nearly a perfect game

Program: Utopia
Supplier: Pulsar Software
Price: £3.95

UTOPIA is another game written by Starship Software, also responsible for *Star Sail* and *Sea Against Sky*. But these pale into insignificance compared with Utopia's latest game and undoubtedly their best.

A Utopia is 'an imaginary state with perfect political and social conditions or constitution'. Until recently (in the game scenario) the man-made colony of the same name was just that. The Galactic Federation built it up into an ideal artificial planet, but now it has fallen into a state of disrepair and as a result is no longer the perfect place it used to be.

Unfortunately, however, the inhabitants of Utopia are unable to leave the planet because of its complex defence systems. Originally they were designed to stop intruders from entering the colony, but what the Federation failed to realise was that the people who lived there were as a result trapped, with no means of escape.

The task of escaping from Utopia has been given to you. As a member of the rebels, you must guide three of the most advanced star fighters, stolen from the Federation, through Utopia's complex defence system to freedom.

The three star fighters in your possession are so advanced

Hard but not too hard

Roger Merrick links OS-9 and a hard disc drive to the Dragon.

WHEN I previously wrote about my impressions of Symtegraph, I shared some of my frustration on using OS-9 on the Dragons. My criticisms/comments should not be taken totally in dissatisfaction with OS-9, or the Dragon, but with the combination of the two. Having worked with it now for some years, but not claiming by any means to be an 'expert', I think, OS-9 is a wonderful operating system, but using it on the Dragon have encountered a number of problems (that I find very irritating).

Floppy discs

I suppose I should be grateful that OS-9 no longer uses single density drives, and I should be 'thankful' that I do not use a CoCo with only 35 tracks per disc. I do recognise that back in the good old days of 1983, a single sided 40 track was the most cost effective solution to providing a floppy disc system for the Dragon. But I feel cheated, in a way that nobody ever made it clear that two drives were really essential for OS-9. Of course, Dragon Data had some terminal misadventure after the release of OS-9, and it was fortunate that they got the OS-9 software released before the collapse. That was in fact the last benevolent act of a shrewd computer company who really did appear to care about their customers (and this has perhaps been repaid by the fact that we are still here five years later). I have been told that Microsoft never wanted the license fee from Dragon Data for the OS-9 software, so there were no legal/financial issues. So in issuing Version 2 to registered users, Microsoft were also being benevolent.

However, all that being so, nevertheless first the standard double density, single sided floppy drive does not provide enough space to store a reasonable set of commands, an application and data on the same disc. Single drive operation is extremely time consuming, requiring modules to be loaded in memory, data destroyed to be changed, etc. Working disks require preparation, and transferring customised BASIC discs using OS9BETA on a single drive system is difficult.

One simple solution is to add a second drive. If this drive matches the original, then online storage is doubled. The original Dragon Data releases of OS-9 only supported the single sided 40-track format. V2 from Eurohard includes dual device descriptors and drivers which support double sided and 80 track formats as well. A double sided 80 track disc quadruples online storage, offering 1,760 bytes per disc. But floppy disc operation in OS-9 is still unsatisfactory — the type-ahead buffer stops working while the disc is being accessed. In fact, I look this to be poor

software writing in the device drivers, but now I come to see it as a problem with the hardware. Also, maintaining a reasonable amount of workspace means having a few modules permanently resident in memory as possible. This emphasises an operational characteristic (for this read 'drawback') of OS-9 — the time spent accessing discs to load modules.

Having seen friends and colleagues with PCs, single-handed systems that provided megabytes of fast online storage, and envied, I thought, well, the answer to the problems of OS-9 on the Dragon is to add a hard disc. The operating system is sophisticated enough to handle it. Then you could have all your commands and applications available at the touch of a 'Disk'.

Knowing nothing about hardware constructions, I searched for a supplier. I looked over the 'off the peg' systems available for the CoCo in America, and stumbled at the cost of bringing one over (with no guarantee that it would work on the Dragon). Competence at one time appeared to have now passed. However, their plans for 're-establishing' the OEM at 12000 weren't the glowing success that might have been hoped, and they abandoned the project. 'People would not be prepared to pay the cost of such a system, sir', they said me. So, at the last 68000 show at the Horticultural Hall, I asked Martin (when if he knew anyone who could do a hard disc interface. Gordon (with a name came up, and some time later I contacted him.

Hard disc system

The hard disc system consists of the following sub-sections: the dragon interface board, hard disc controller board, power supply, and hard disc driving software. There is a small interface board that fits inside the Dragon, mounted on the shoulder of the lower casing, above the keyboard. This board contains four components, and is wired into the Dragon's pins by several connectors. A 50-way cable leads out of the board to a hard disc controller board (from an IBM-compatible) in the next section. The board mounted in the Dragon is very simple. The connections to the Dragon pins are more complicated.

But this is all the Dragon-specific hardware. Gordon will provide the hard disc and power supply, or the customer can provide their own. If you intend purchasing a hard disc, ensure that you have information concerning the number of heads, power consumption, track to track access time, and damaged sector map. If buying a second hand drive, do be careful in choosing. See a and working, or don't pay much for it. You can't do any maintenance on a hard disc the way you can with a floppy drive. In my

case, I had acquired a 10-megabyte Seagate half height drive. It is the same size as a half height floppy drive. I had expected to be able to run it from the floppy power supply, but the starting current load of 3.5 amps was too much, so I required a more powerful 'switched mode' type of power supply. Generally speaking, this type of supply is essential, as they are expensive, so budget for it. A new one might cost £30.

The Dragon interface board includes a controller chip, and data transfer takes place by other wise unexciting above LPT/IO. It is possible, therefore, with appropriate software, for the hard disc system to be used by Plan, OS-9 and native DragonDOS. However, Gordon only supplies OS-9 drivers. He feels, and I share this to an extent, that only under a sophisticated system such as OS-9 is it worth using a device such as a hard disc.

Set up

Having had the interface installed, and purchased the controller card and power supply, I was anxious to get up and running. The first thing to do is format the hard disc. A utility disc of OS-9 modules is provided. Because of the way the BASIC command works in DragonOS, it is unfortunately necessary to BASIC from floppy, so that was what I did. The message 'OS-9 version 2.4 Welcome to Gordon's OS-9 system' greeted me.

*Having seen friends
and colleagues using
hard disc systems
that provide megabytes
of fast online storage
I thought, well, the
answer to OS-9
problems. . .*

Using MDR from my standard system disc showed the presence of the device descriptor for HD68K and HD, in addition to CGMR and DORFMS. The 'E' option showed HD68K's size as approximately equivalent to the DORFMS module.

It was then necessary to format the hard disc. The PCFORMAT module on the utility disc is totally different from the standard system module. It asks for information about the hard disc — number of surfaces (heads) and sectors. This information must

be known, as incorrect data could in fact damage the hard disc.

A further piece of information required is the so-called interleave factor. This refers to the fact that physically consecutive sectors may not have consecutive numbers assigned by the system. This is due to the fact that in the time taken by the system to read and read a sector, the spinning disc has moved on. If the system had to wait for

the OSAVE command, the contents of the floppy distribution disc of Stylusgraph are transferred to the hard disc directory STYLO. When using the STYLO program, a file can be contacted with the READ command, or a text editor, to COPY over from the master CMOS directory to the STYLO/CMOS subdirectory any additional commands that may be required. Others prefer to have the disc structure organised around a file's purpose rather than language (eg to work on household accounts files, CHM to a directory of HOUSEHOLD ACCOUNTS rather than DYNAMALC/HOUSEHOLDACCOUNTS).

I chose to construct a master CMOS directory from the system disc, and a number of directories representing each floppy disc that I subsequently stored on the hard disc (ie OSAVE) — one for ISSAC92, one for STYLO etc. My OS9 drive now discs I saved hierarchically under a directory of OS9ANDCMOS92.

Remembering that a postlist is limited to 254 characters (keyboard buffer length), and to reduce opportunity for errors, short directory names are to be preferred. Another point to bear in mind is that only one file with a given filename can exist within a directory, so if OSAVE encounters a module with a given name in a directory, a revised updated module being loaded in from floppy will not be stored. OSAVE will report an error 248 and carry on. The user must then manually remove the existing or updated module and load the module from floppy.

In use

Because of the device independent IO structure of OS-9, all commands that report the state of a device can be submitted to HD such as DIR, FREE, DCHCK. The first point that became apparent was that many applications had been hard-coded to refer to DO for various reasons. STYLO looks for the proportional spacing table on DO, SPFILE looks for the dictionaries on DO, etc. There are two approaches to dealing with this either rename the HDISK driver to DCHCK, and HD to DO. This will cause problems for floppy disc operation. Or use DCHCK or other utility to search for references to DO in programs, and patch to HD. Because of the slip of HDISK, D9900n should be used to create a BOOT file of a minimum number of modules. Once all applications are patched to replace references to DO with HD, it is not necessary to refer to the floppy disc at all. Therefore, DCHCK can be left out of the OS9BOOT, and loaded into memory from the startup file (being able to be removed whenever required). Having created directories for all my OS-9 applications, including separate directories for VICE92 and COCCO92, I have used approximately one quarter of the space in my 5 megabyte hard disc. This is with substantial duplication of files.

A major advantage is speed in use. There are two aspects to this — the data transfer rate of the hard disc, and the effec-

tive track access time are faster with a hard disc than with a floppy, so modules are loaded into memory, and files are saved from memory, and much faster with a hard disc than with a floppy.

Disc snags

Recently, with all commands and applications on-line and accessible via CHM, there is no time spent swapping discs. For example, if HD OS-9 can BOOT up, load a previously built file to call D9900n and customise STYLO and the floppy device descriptors, load STYLO and construct a C program, save and compile it, go back to STYLO, construct a BASIC92 program which calls the C module.

The speed at which modules are loaded into memory means that the storage device is almost like an extension to ram. This is how the 64K limitation can be overcome. Regular use of OS9 gave me a different perspective on my home computer. My Dragon became a terminal to an abstract OS-9 computer. Now with the hard disc, the OS-9 computer takes on a more definite form. Since the hard disc system, by adding so much on-line storage, gives me the opportunity to personalise my OS-9 system, the peripheral device takes on a crucial importance.

There are snags, of course. The importance of the hard disc to my system is also proportional to its fragility. I've been running the system for approximately one year now. But I've never written about it before because I have suffered problems with the hard disc 'going down'. Since looking after a difficult and time consuming problem, I ended up not doing it and when the system crashed, instead of work (serves me right).

Plugging up hard discs is even more trying than plugging up floppies and the consequences potentially more disastrous owing to the large amount of work capable of being stored. However, the principle that the files which you lose are always the hardest to restore is equally true of both types, says your Editor with feeling.)

I have carried out some benchmark tests on the performance of the HDISK+CHMing sequence combination, and they were a mix of respectable results (compared with current machines) and some poor results. Gordon has rewritten the driver so I intend to wait and report on the performance of the new version.

A number of people, users of other computers, have looked at what I have described the system. Why they say, would you want to load a powerful peripheral onto a rather humble machine like a Dragon? This displays a lack of understanding of the power of OS-9, and the different approach to computing given by the combination of powerful operating systems and hard disc.

The total cost of about £150 — £200 may seem a lot of money, but if you are into OS-9, have a significant investment in software and a pioneering spirit, you should go for it.

The importance of a hard disc is proportional to its fragility... since backing-up is time consuming, I ended up not doing it, and lost a lot of work (serves me right).

If the physically consecutive sector was back in position, time would have been wasted. More efficient is read the sector that is under the head at the time. Setting the interleave factor obviously requires detailed knowledge about the speed of operation of the system. This is not available, so I took the default values, making a mental note to try different interleave factors in subsequent format operations. Then the operator must choose logical or physical format. The former is equivalent to format without verify, whereas the latter will verify and lock out any erasable tracks.

Naturally a single format, the physical option is selected. Although the formatting process works much faster than on a floppy system, with so many sectors to format a considerable period of time is taken. The operator must stay with the system during this time in case any action need be taken. After an apparently interminable period of time (15 minutes) the disc is formatted, and the command FREEHD came back with the satisfying answer '14,000 sectors'. The next steps to transfer all OS-9 programs to the hard disc.

Hierarchy

Bearing in mind the hierarchical directory system, preliminary thought should be given to the data structure. Essentially one may choose to have one master CMOS directory full of commands, probably ordered into a number of subdirectories, or set up a directory for each application (eg one for Starb, one for Pascal, etc) each with its own CMOS subdirectory.

The latter approach involves some duplication of files, but may be easier to use. Consider a directory called STYLO. Using

Dragon Invoicer

Craig Henderson plans a prosperous future.

If you have a printer to go with your Dragon, have you ever wondered how much more you could use it and improve on the presentation of your work?

As lately I have been keeping a much closer eye on my income and outgoings (credit and debit, getting into a good habit for when I leave school), I have written this invoice compiler to compile, print-out, edit, save and load all appropriate information. You can use it to keep a careful watch on your money.

When you first execute the invoice compiler, the title screen will be displayed and you will be asked if you would like to load an existing invoice off cassette. Press (Y) or (N) correspondingly. If your reply is yes (Y), the program will then go on to explain what to do step-by-step and when the invoice is loaded, you will go into the main menu. If not (N), you will go straight to the main menu.

With the main menu you will have five choices; pressing (1) will send the current invoice to the printer as shown in **figure one**. The printer is set up for an 80 column printer, but this can be changed by poking location 156 in line 6 to the printer width and location 152 to location 155 divided by 4 (type POKE 152, PEEK(155)/4) and changing line numbers 2080/2071 to contain the appropriate width minus 21. Pressing (2) will take you into the ENTER mode. In this mode you will be asked to enter all the appropriate information to build up an invoice.

The screen will clear and the question "HOW MANY DAY ENTRIES?" will ap-

COMMAND KEYS.

WEDNESDAY	JULY	01ST	82.80
WEDNESDAY	JULY	01ST	82.80
WEDNESDAY	JULY	01ST	82.80

04 WEEKS-DAYS	@ 82.20 EACH	= 328.80
04 WEEKS-DAYS	@ 82.80 EACH	= 331.20
01 WEEKS-DAYS	@ 82.80 EACH	= 82.80
	TOTAL	= 742.80

per. Day entries refer to the lines of text in the invoice which have the status:

DAY MONTH DATE AMOUNT

The prompt for a title is next and then is followed by a prompt for the month(s) of work, then the date that you began work followed by the date that you retired from work. When you have done this, the screen will clear again and the title of the invoice will be displayed at the top of the screen, followed by the entry number and the prompt ENTER DAY. This is the day of the entry number which is displayed. If you don't enter a valid day, the machine will tell you so. When you have done this, you will be asked to enter the month, and again if you enter an invalid month, you will be told. Next enter the day(s) and the amount. On the amount, if you just enter the figure, a hash (#) will be displayed in front of it later on, but if you precede the figure by a hash (#) yourself, that is OK.

Once you have done this for all the entries, you will see display as in **figure two**.

You fill this in using keys 0-9 for the figures and the left and right arrow keys for editing. If you need to enter a 3-digit

Adventure Trail

Dragonsoft

New software for review should be sent to Dragon User,
60 Alexandra Road, Hounslow, Middle TW9 4NF.

Continued from page 11
that they have laser beams that cannot be seen. This prevents the enemy from dodging the lasers, and makes your ship almost totally indestructible.

However, as period Utopia's defenses, there is a fleet of kamikaze shuttle craft which, instead of firing at you, will home in on your ship and attempt to collide with it, unless you can stop them.

The planet surface is strewn with objects. Many of these are defenses, some are just plain obstacles to avoid. Among the defenses are the aforementioned shuttle craft, rocket launchers and land mines.

To aid your progress in the game, there are various fuel pods strewn around the planet which must be flown over in

order to raise your fuel levels. It must be noted that the main aim of this game is not to achieve outstanding scores, although it is nice to do so, but to retain enough fuel to enable you to fly out over the planet.

As soon as a fuel pod hits time you destroy an enemy craft, although your score can considerably increase when your ships are flown over certain strips of land.

Should your fuel fall below zero then should you hit one of the numerous objects, you will immediately die and be sent back to the beginning of the game.

This is a charming primary game; it is a bit soft, but it is the game problem. Why programmers continue to use this irritating routine puzzles me. The real effects that the user will

become very bored with the game is, every time he or she dies, they are sent back to the beginning to repeat what has just gone before. It is particularly annoying when you are just short distance from the end of the game — not that I have got that far with this one.

Utopia is a difficult game, perhaps too difficult. Maybe some of you will say that this provides a challenge, but the game really does suffer from only giving you three lives. Naturally can be expected to complete a massive game like this with only three lives. No doubt the hackers will come up with a miracle cheat code which will dramatically increase lives.

The graphics are really first class. I would say they're among the best I have seen,

although the screen and your ship do occasionally flicker at the screen scrolls. The sound and music are excellent, the title music in particular is pleasant and well put together.

Utopia is a bit like a former game for the BBC called Perma. Utopia doesn't look anything like Perma, but the aim is virtually the same and the two games have the same feel — and like Perma, it is unnecessary to get killed.

For my money Utopia is one of the best Dragon games of all time despite minor faults, and Jonathan Cattermole and the rest of the crew at Dragon deserve praise for the work on it.

Donald Morrison

No red herrings

Program: The Great Fish Van Standard

Supplier: Orange Software
Price: £2.99

The Great Fish Van Standard is the standard adventures from the newly created Orange Software. Even an adventure has a ridiculous storyline behind it, this game certainly does.

One day a strange thing happens to you: as you walk to work, you are jumped by two masked men, blindfolded, tied up and gagged and thrown in the back of what smells like a fish van. Then you are left on the floor, and when you regain your wits, you are in another smaller damp cell. Alternatively, negotiating the London Underground during the Thursday night rush after the smell of something, you unconsciously find yourself in Euston Station too without remembering how or even why

you got there — One Of Our Correspondents.

It sounds as though somebody has recently exercised imagination! The game starts off in the damp cell, with water dripping from the ceiling and rats scurrying beneath a pile of straw.

The only visible object is a blanket. EXAMINE BLANKET reveals that there is nothing special about this blanket. With no exits apparent, the only direction seemed to another part of the cell, where there is a grille in the ceiling. The only way out would be to buy your way out, but as you have nothing sharp at the moment, you have to wait another day.

Back to the first location, and soon realised that the only way out was under that pile of straw, though quite how I still don't know.

The game supports the usual

verbal input with NSEWUD for directions. Verbs include look, examine, help, score, but, kill etc, and the usual lowercase commands.

However, despite the inclusion of verbs like kill, the game will not tolerate violence — on receiving a violent command, the game will stop and the computer will cold-start. Don't panic — it's not a bug. As soon as you press a key the game will react with a warning not to use violence.

There are a large number of locations in the game, and many of them contain elements of humour, though the game boxes precariously between humour and dodgy language in parts. (Mr Morrison offered an example of a dodgy abbreviation here, but we couldn't think of it, so I leave it to the greater wit than myself — DJ)

The game operates totally in text, which hasn't been re-defined. Nevertheless, the

author has managed to keep his descriptions fairly detailed and the screen is quite well laid out.

Although the game operates in Basic, I play at a reasonable speed. As with most Basic games now, it's well protected with the Break key being disabled as well as the LIST command.

There seems to be a slight bug in the game, as every time you type QAT you lose your lip and eventually die, regardless of whether or not you are eating anything at the time.

It's a good, well thought out game with a totally original idea behind it. Not one particularly for the beginner, as it is fairly complex, but should appeal to the hardened adventurer.

Donald Morrison

Colour connection

Ray Deakins makes a hardware mod to balance the Dragon's colour

The December issue of Dragon Answers contained a letter asking if it is possible to correct the colour balance on a D32. The following short article might just help. I am assuming that the writer of the letter has already tried adjusting the UM101 modulator to no effect.

The D34 (and some of the later D34s) use a small variable capacitor instead of the fixed value 10pF capacitor (C7 on the D2 — C22 on the eq). The value of this should be between 2 and 22 picofarads. (Magnin part, no. W170M.) This component is located on the main circuit board top left hand side, immediately below the crystal B11. If you are handy with a soldering iron it should not

take very long to make this modification. With the new capacitor in place and the computer switched on adjust the small screw with a non-magnetic, insulated screwdriver until you get the best colour response.

Changing this capacitor has improved the colour display on the two Dragons that I have modified in this way (both with issue 4 power boards and the Astec UM101 modulator). The issue 3 power boards have the UM101 modulator and a slightly different circuit. Although I see no reason why this should not work, I cannot guarantee that this will cure the problem, and suggest that anybody contemplating

making this modification should only go ahead if they are fully confident in their ability to do the job, and reverse it if necessary!

The following short program will help to set up the colours. To use the program to its full advantage, it is essential that your TV is set up correctly, ie colour balance, etc. Display time can be altered by changing 1800 to any desired value.

The National Dragon Users Group, or Pooksoft, may be able to help with circuit diagrams if required.

Incidentally, 1980 is the year of the Dragon! Let's keep it that way.

Winners and Losers

Every month
Gordon Lee will
look at some prize programming

THIS announcement of winning entries from the February competition in May's Dragon User must have sent shock waves of curiosity through the computing public. "How was it done?", I hear you ask, between gasps of amazement. "If you take the computation of the one hundred digit product of two fifty digit numbers in a time of under 10 seconds! In fact, the winning entry achieved a time of under 4.3 seconds — reduced from the 278 seconds running time of the example given in the question.

The timings given are those found by averaging a number of trial runs. The second decimal place may vary from run to run for from machine to machine, but these timings should be typical from the timings given here. More than a word of any "speed" prize is not permitted as the setting of the timer is zero and the product of the time taken must be the first and last command of your program respectively.

The method used by the three runners, up to now, has been basically similar. This was to reduce the number of calculations to be made by splitting the two fifty-digit numbers into groups of 5 and 4 digits respectively, and then multiplying each of these groups in turn, the product being inserted in the answer string at the correct position. In this way the first fifty-digit number can be split into two five-digit sections, while the second number can be split into thirteen four-digit sections. In this way the multiplication part of the computation can be done in just 130 steps. The Dragon can handle the multiplication of a five and four digit number into a nine-digit product without any difficulty and the running time can be significantly reduced.

The winner, Pete Faraday, was able to do even better and complete the calculation in half the time of his nearest rival. Once again, this was achieved by taking groups of digits but the edge was gained in convert-

ing these to an array of numeric variables. As Pete says in his note of explanation:

"As is broken down and stored in the array A, B is similarly broken down, and each part is multiplied by the stored parts of A. These products are added into an array C. Only after this is done are the carries within 2 calculated and the values within 2 corrected. 2 is corrected back to 0."

One interesting feature of three of the listings is the use of a command which, although acceptable on the Dragon, is not always possible on other machines. As far as I am aware, it is also a command which is not used in the manual supplied with the Dragon, although it is quite a useful com-

mand. Readers acquainted quite familiar with the command

$$25 = MID$(A$,4,3)$$

which places in variable 25 the three characters from A\$, beginning at 4.

Not so well known is the "inverse" of this command which is shown in our list on line 20 of the following short listing:

```
10 A$ = "ABCDEFGHIJKLMN" : Z$ = "XYZ"
20 MID$(A$,4,3) = Z$
30 PRINT A$
```

Quite predictably, this produces the not unexpected result of "ABCDEFGHIJKLMN", and yet this is a command that is not accepted by some versions of Basic.

Write: ADVENTURE

Pete Gerrard rings changes on theme

I received an interesting letter recently, from one Robert Traugott in Knapley (Yorkshire, wrong side of the Pennines, but we'll let it pass), who has this to say: "The boss is trying to write my own adventure recently, but haven't much idea what to do or how to go about doing it". Help developed a fairly reasonably parser (calling "Take the large sword and drop it" as an example), but then ends up with a general plea for help and ideas.

Since it occurred to me that a number of people might be in a similar position to Robert, that of knowing the basics (and possibly basics) but not being quite sure how to go about putting it all together, we'll spend this month trying to help you all along a little.

Choose your system

Most people who write adventures either end up developing a system of their own and then fitting everything into that, or they use an adventure writing system developed by someone else and have to find a way to modify their own way of thinking so that the adventure they're contemplating will be able to be written by using that particular system. It's no use coming up with an idea that allows you to swap from one character to another if the system in use has no way of coping with that.

So first of all ensure that the game you're going to be writing can actually be written! Basically if you're going to be submitting a design rather than the finished thing, study other games by that company and make sure that what you're sending them isn't worth what they have already done. Otherwise you'll get a rejection along the lines of "great idea, but our system won't be able to handle it". Translated, this means that they probably like the idea but are not willing to spend the time and energy in extending their systems to cope with whatever vagaries you've introduced. And why should they? For many adventures that won't fit into their way of programming they've probably got half a dozen ideas that will.

For simple and totally unoriginal examples of this, take the age-old problem of having to find a key to open a locked door. Having found the key, the player might reasonably be expected to go back to the door and type in something like OPEN DOOR. A simple line of code like:

```
IF key carried AND current location AND door locked THEN unlock door
```

will sort everything out. Most adventure systems can be expected to cope with something like that, although I suspect to a personal preference for not particularly liking games that have seemingly hundreds

of doors and hundreds of keys scattered about the place, forcing you to spend an eternity finding the right one for the right door. Then, when you do, and type in OPEN DOOR, the program responds with THE DOOR IS LOCKED. I know it is, stupid, that's why I've spent half an hour finding the key and am now telling you to open the wretched thing!

From little problems mighty adventures grow, and if you are going to have a locked door then for heaven's sake put something interesting behind it so that the player gets some slight feeling of reward after opening it. Perhaps make it a double, or even a triple, locked problem. The lock might be covered with a panel that is made with age and cannot move, and when you do find some oil and free it you then discover that there is something stuck inside the panel after the key and you have to drag it out. A little deviation from an ancient position makes all the difference to the player.

Too many adventures, though, seem to rely on locking and unlocking things in order to succeed. Doors, chests, cabinets, safes, most of the games that I've seen need something to be unlocked at some time or another, so another of the 'gating you started' ideas might well be to use oil to lock things. It might make the game harder to write, but it will be a touch more original.

And since originality seems to be the name of the game these days, have our mazes as well. Easy enough to program though they may be, I personally find them tedious in the extreme.

```
IF (ROOMX=1) THEN GP=POW(POC:GOTO 10
```

On something similar itself that is needed to get a player moving around, not outside of a maze. If the array POC contains the number of locations and the number of available exits, GP is the current location, and NO is the direction that the player

wants to go in. However, moving around within a maze could easily be achieved by simply having six or so locations that all have the same location description, such as "You are in a maze of twisting tunnels, all alike" to quote the original. Then, whenever the player moves, the location description remains the same and the player has no idea whether the move has been advantageous or not. This sort of maze is relatively easy to write by dropping objects and mapping your progress like that. If the object's still there when you move, then you're in the same location. On the other hand, the programmer can make things more difficult for the player by having something like this in the GOTO routine:

```
IF (GP=48 AND GP=53) THEN GOTO=C:DPFMT message
```

This assumes that the maze is in locations 47 to 52, and the array C holds the current location of all objects. Getting that location to zero would mean that the object had vanished, and the message could be something along the lines of "As you drop the object a genie appears in a puff of smoke and steals it, saying that he'll leave it outside the maze for safe keeping. He vanishes in a puff of greasy smoke". Thus the player can now no longer trap the maze by dropping objects.

A logical maze

Whether or not you have a maze in, of course, up to you. I don't like them myself, but some people do actually seem to enjoy solving them. But if you do have a maze, try and give it a purpose. Some of them just seem to be there for the sake of being there and being a nuisance, with no reason behind their sudden appearance of a maze in the middle of nowhere. Make it a construction maze (a London adventure might use Hampton Court, for instance) with something at the centre of it, perhaps. Players do like to feel that they've achieved something by solving a maze.

Another old chestnut, which can be given a variation on a theme in order to get the budding adventure game writer started, is the perennial problem of light and dark. Many many games have you roaming around looking for a torch before you can go on, or you can't see at all, or, otherwise, you aren't able to see where you're going in the dark and fall into a pit to be later consumed by a malicious drive.

```
IF (GP=32 AND GP=40) AND PO=1 THEN PRINT message
```

That sort of line could easily be added to the movement routine, with locations 32 to

26 being the dark ones. If the variable PD is set to 1 then the player has not found a light source, and the message could read something like this: "As you try to move in the dark you trip and stumble, almost knocking yourself out as you fall into a black pit." The last thing you see before you faint from sheer terror are the burning eyes and staring jaws of some unknown beast". Peter waves lyricist.

Some adventures do allow you to roam about in the dark without falling down anywhere, but of course you cannot see objects that might be hidden on the ground. This is wrong, everyone's eyes adapt to the dark eventually, so a solution might be to make the player stay in the dark locations for a set number of moves before they can see the glittering jewels lying half-concealed behind a rock. Or, you may care to consider having a light source that goes out after a certain number of moves.

Then again, you might care to have something totally different. One adventure

of mine featured a cave area that had to be explored, and there was also a torch. Unfortunately the torch didn't work, and never would work, so some other alternative had to be found. This alternative took the form of a guide dog, who would happily guide you through the caves and prevent your feet from stumbling, in return for a spot of food. Added to this was the length of time taken to move, so that the player's eyes adjusted slightly and were able to make out a few of the racks in one corner of a particular cave. "Racks racks?" It was a strange adventure!

A troll's pint

One final point to consider for the beginner to the world is another favourite that could easily be changed in order to add character to the game. This is where a certain being, such as a troll, blocks your path and will not let you pass until you give him something.

If: QP=45 AND OBtroll=OP THEN PRINT message

If the troll is blocking your path, and it's location is, then give a message to the effect that "The troll sneers at you from the other side of the rocky old bridge, and refuses to let you pass". Fortunately, by using your bridges in front of you, only to be told "The troll doesn't like people playing with his bridge, and stomps out the fire before it can take hold".

Almost inevitably the item that you have to give the troll will be one that you want to use again later, so that the player will have to think of some way of getting it back afterwards, but you could do this same sort of problem in a totally different way. You could invite the troll for a drink or something, and when he gets to the tavern and studies the door to see if any other trolls have been in he could find that there were no names at the inn and so go elsewhere to find a drink, leaving you plenty of time to scurry across the bridge. If it was a rope bridge you could roll it up after you and thus prevent the troll getting back across afterwards. All variations on a theme, and with that, goodbye!

Professor Deadstock time again, after last month's whinge against people who should know better, and as promised we have the old boy in for his unique variation on an adventure that I get a number of enquiries about, namely *Pyramid of Doom*. Thanks to Michael Edwards and R. Steinhart for giving the good Professor a helping hand on those occasions when his feet stumbled slightly.

Dear Diary,

Pyramids and sarcophagi (or is that sarcophaguses? Makes them sound like some sort of aquatic material, a kind of sarcophaguses approaching the star-board bow) abound on my latest travels abroad, and one cannot help but wonder what Bender would have made of it all. Still, curs is not to reason why, and having left the admirable courier behind (almost enough ago, but does it rather too hard to ensure that we did forget how what he refers to as 'good times') I had the misfortune to stumble slightly and had to grab a pole to keep my balance. Heaven preserve us, the pole was in fact a shovel, and fancying that such an implement might come in useful late (as I look

hold of the thing and went to a nearby pool. A curious ray and some liquid of a rather dubious nature from the eastern ocean came into my possession, and after travelling first east, then north, then east again, I leant on the shovel to pause for breath and found myself digging!

I unclassified a somewhat small key, and after taking it west north, whereupon I was digging with gusto, so that familiar Deadstock instinct told me that something of value might well be revealed hereabouts. A large hole was revealed, to be precise, and upon going into it I found a door. Door unlocked that, I can tell you, and immediately retrieved up again. There I dropped the shovel and took hold of a stone. Something about it caught my fancy, can't say what. I unlocked the main door and well in, feeling vaguely guilty as I did so, for no apparent reason. Perhaps it is that fear, inherent in most of us, of being caught when one ought not to be. What would the courier say? In a fit of excitement I dropped both keys and it is my lastings. I was in the Pyramid of Doom, and immediately took a rest before pressing on further. It would not do to be caught unawares.

I glanced upon a sarcophagus (wrote it down) and opened it. Proceeding by some inner instinct I headed north then east, and to the left (before I found a flute. Strange looking artifact, I can tell you. A quick glance west, south, and south once more, and I was in an unusual place. A little table of mine, I know, but in such circumstances I could not help but try and relax by playing the flute. Not that I am one of nature's natural tunemasters, but there you have it.

I studied the fireplace and found some coal and ashes, although I had in fact twice before the ashes revealed themselves. I made a mental note to check with my optician after the holiday was concluded. The ashes looked strangely un-natural, and upon further examination I was able to find a necklace! That could come in useful at the next bridge-meeting. Having got the necklace I entered a passage and immediately headed north and east. Some strange graffiti could be found here (I use the word graffiti, teleo-graphic becomes to become after a while) and upon reading it I decided to drop the stone and necklace. The stone was becoming something of an unwanted burden anyway. A little jerry attracted my attention (suitcase ward, and one cannot help but fear for the future of the English language), and I took it before proceeding further.

I went west, then north, where I saw an astonishing sight. An ogre was looking straight at me in my slams at this unexpected intrusion on my privacy I dropped the jerry, whereupon the ogre immediately ate it and presented me with a pearl. Naturally enough I took a keen hold of the pearl as it looked off towards an archway that sadly failed to resemble that glorious example that is surely a little bit. On going east I unconsciously dropped the pearl, and in my haste to find it I hurried west and north. Somehow I also managed to lose track of the flute, but I was never much of a virtuoso, and James Galway would have no fear of my musical talents displacing him.

Red as coal

I proceeded west and south and returned to the wretched sarcophagus. Some inner instinct seems to constantly drag me back towards it, I cannot think what it all might mean. I went down, losing my step slightly as I did so, and chanced to brush my arm against the coal that I was carrying and fire burst forth. It was sturdy, but clearly not one of any great value and certainly not something that could be worth taking down the Pontefract Road for evaluation. What had caught my eye and seemed to be less than my usual careful self were some burning leaves, and I immediately thought of that blessed log from the cart. I poured water all over them, extinguishing them, and was able to get what was obviously an immensely important tapestry. Peruvian, I shouldn't wonder, although I may be wrong. I am no great ex-

pert. I went to an alcove, and peered intently at a box that was lying there. I did a double take, looked again, and there was an iron glove. The sort of thing that Miss Tyson could wear, no doubt, although he would not like the day he crossed me I can assure you. Not that that is likely to happen, as I have a very forgiving nature. An old skull took my attention, and on glancing the most thorough of examinations I was able to ascertain that it had some gold teeth that were most definitely not National Health Service issue. I added them to my growing list of goods.

I performed my usual trick of heading west and south, but in my haste I somehow managed to catch my arm on something, a protrusion from the wall I fancy, and accidentally let the skull fall from my grasp. Good heavens above, what is the world coming to! I hurried north as fast as I could possibly go, and still further I went in my efforts to escape. Fearing attack I donned the iron glove as a suitable weapon, but my hands had become so drenched with perspiration in my fight that I initially dropped the useless thing. With my patience rapidly approaching the end of its tether I replaced the glove and proceeded. I was going so fast that I almost collided with a door, and only a rapid motion of my hand prevented me from turning head-first against it. I dare say that to the casual observer it probably looked as if I were hitting the door, and he promptly removed the glove for fear of infection. I don't think that will have any further use for it.

Gemmed to death

I found a ripe, and my old instinct told me that this could be of immense use, as naturally enough I carried it with me. I headed south and south again, back to where I started my heading fight, and went to the ladder. By the most chance I stumbled slightly, and so was forced to go to the ladder a second time. I threw myself up to the ceiling, to help me get up there, and had visions of the most awesome pharaoh striking me dead for my impudence. What could possibly afflict at this apartment that appeared before me? The ruby was worthless, and feeling somewhat akin to David against Goliath, I threw the thing. Fortunately my aim was good and my blow was true, and I killed the fiend. I smashed a sarcophagus into my possession as reward and offered myself a pat on the back. I did not turn the offer down.

I headed south and examined the strange looking collection of rubbish in front of me. An explorer in my turn I examined them also, although this latter act was performed with some little dislike as I most certainly did not like the cut of his jib. For my pains I was rewarded with a pin and a canning, and after that worthless task was concluded I went west and down, dropping the canning as I did so, and replacing its presence with a saw. My mother did not raise me to be a beast of burden but that, then, is what I am rapidly becoming, as

I am forced into being a human ship of the desert.

My journeying became ever more exasperating as I went north, then up, then west, then north again. Some inner stirring of my heart was quelling me, of that I am sure. Another crickety looking table seemed bent on being seen into two smaller tables, and this I did. Upon completion of this task, and at the cost of scratching elbow to remember that I am no longer the athlete of my youth, I dropped the saw and took hold of the necklace that had appeared. I slipped out smartly to the east and the somewhat ludicrous archway where I could carry my baggage no more and so dropped tapestry last, red Mass pins, canning, and tapestry that ten years prouder, and after a slight pause to catch my breath I trotted all towards the west and then turned north and went again.

Beetling home

I retrieved my saw, and after stepping out smartly to the south I retrieved both my keys, thanking the good Lord that no-one had appeared to steal them. Once more I returned to the wretched sarcophagus and went down, then south, then to the ladder. Once more I headed south and proceeded to my ripe, following which I opened the chest and took out the most impressive looking crown that it has ever been my pleasure to behold. Feeling somewhat foolish, and rather as if I were in my own bathroom back home, I pulled the chain. I went to the stairs, stared my way through the bars, and was finally able to drop the saw for the last time. Wishing to return glove for safety I unlocked a coffin before dropping both keys, again for the last time. Inside the coffin was a bracelet, which naturally I took.

I went back to the window, got a bar by that curious inner feeling known only to us Desalvians, and then performed the most extraordinary series of movements, so bizarre that I almost became giddy, and can only set them down as I performed them: west, down, down, west, down, north, east. Such confusion! I went through the door, but unfortunately slipped and was forced to put both hands to delay my fall. On feeling the floor I discovered a coin, and took it with me. I headed east, lighting my flashlight in the gloom as I went. What I thought was a scurrying beetle turned out to be a stationary mouse, so I took it. West, then west again, re-lighting my possibly faulty flashlight as I walked, thereafter heading south, up, west, north and east before ending up once more at the ludicrous archway. East again, and added to my collection the saws, coin, bar, crown, and bracelet. "A score of treasures!" I murmured, but must have spoken louder than intended, for on saying the word "score" I was transported home and my latest holiday was complete.

What an interesting time he does have to be sure! See you next month.

Is this a record?

Gordon Lee really is going round in circles — almost

MOST of us are probably familiar with the old catch question: How many grooves are there on a gramophone record? The answer, of course, is two — one on each side. A similar problem arises: How far does the stylus travel while playing one side of an LP record?

Both of these depend on 'pitched' in the way that the questions are put. However, a person who sees through the first of them is more likely to be tripped by the second. The 'trick' to both is dependent on the person seeing that one side of a record contains, to all intents and purposes, a single spiral groove which commences at the outer edge and then spirals in towards the centre. Consequently, when asked the second question, the temptation is to try to calculate the approximate length of this spiral track and to give this as the answer. In fact, the true distance that the stylus travels is somewhere in the region of four inches! — that is, the distance that it swings from the outer edge to the inner 'musical' groove on the disc. The fact that the record is rotating beneath the stylus does not affect the distance of actual travel — except to guide it slowly towards the centre.

The spiral found on a typical gramophone record is of the type known as an Archimedean spiral. This is the locus of a point which rotates around a fixed point, the distance between those points decreasing at a constant rate. Consequently, the distance between adjacent coils of the spiral will remain constant. (Yes, I know that for certain technical reasons in the manufacture of records, this distance may vary slightly depending on the dynamic range of the music being recorded — but you get the idea). A child on a playground roundabout who rotates at a constant speed

along one of the radial handrails would move in an Archimedean spiral as seen from the ground.

```
100 P=0:G=0:SCREEN 1:G:PCUR
110 P=0,0:G=128:Y=92:X=90
120 FOR S=0 TO 1 STEP 0.02
130 G=G+0.02
140 CIRCLE (X,Y),R,S,1,S,E
150 R=R-P
160 IF R=0 THEN 160
170 NEXT S:GOTO 120
```

A reasonable representation of an Archimedean spiral can be drawn on the Dragon's 640x screen using either of the two listings given here. Listing one is a rather more straightforward method of con-

```
100 P=0:G=0:SCREEN 1:G:PCUR
110 P=0,0:G=128:Y=92:X=90
120 G=0:R=1
130 G=G+0.04:R=R+0.01
140 G=G+0.04:R=R+0.01
150 DRAW "HTD",92
160 FOR J=0 TO 90
170 L=240+40*G:R=R+40-40*G
180 MH="H":MH=L+R:Y=92+R*H*H
190 G=G+0.04:R=R+0.01
200 G=G+0.04:R=R+0.01
210 NEXT J:IF R=0 THEN 160
220 GOTO 120
```

ing the computer's 'circle' command to draw small circles repeatedly, each time reducing the radius a fraction to move the

line in towards the centre. This is not a true spiral, but is instead a series of arcs of circles, but the final result is quite satisfying. Interesting effects can also be obtained by using elliptical spirals. This is done by altering the 'height-width' ratio of the CIRCLE command at line 140, page 100 of the Dragon manual describes how this is done.

A more finely-tuned spiral can be obtained using listing two which uses the sine and cosine functions to compute the coordinates of each part of the spiral. In both of these listings, variable P is used to control the 'pitch' of the spiral and can be altered to adjust the rate at which the line converges on the centre.

Another type of spiral is that obtained by constructing the 'involute' of a circle. Imagine that you are confronted by a fence dog who, fortunately is tethered to one by means of a long rope. By keeping just out of reach of the dog, and by moving round the tree, it would be possible to make the dog wind the rope around the tree. The path that it would take would be the 'involute' of the circle represented by a cross-section of the tree. Here, it is the tangent of the generating circle that is decreasing at a constant rate (as represented by the rope) rather than the radius as in the Archimedean spiral. To the naked eye, these spirals would both seem pretty similar, but the difference being mainly in their methods of construction.

To complete the picture mention should be made of a third type of spiral, the logarithmic spiral. This is the most widely found spiral which occurs in nature, from the very small pine arrangement of the seedling to a daisy head to the very large shape of many of the spiral galaxies in

Prize

Competitors who survive the giddy spirals of Gordon Lee's imagination will be waiting a treat. To assist them, we have negotiated a property deal with Dragon magazine **Preston Software**, last seen dealing in absolute island homes: ten copies of **Hotel On Mayfair**, the classic game inspired by Monopoly, await the worthy winners. Take up your stations...

Rules

Have you established a new record for the most effortless and most elegantly of measuring the distance from the plane to the centre on a LP record short of listening to the latest chart topper by Sade (yephes with glory)? Or are you all a bunch of staid party-plans (compact disc players)? Pick your answer and program in a piece of paper marked **AA/VS/ST COMP**, add any famous last words and post it to us. That hotel could be yours.

But the tebreaker! Let us not forget the tebreaker! Just complete the well known phrase of saying: 'If I had a hotel on Mayfair, I would... — every day, impress us with your hedonism, (for an obituary in the dictionary) (heck, who's got my dictionary?)

May winners

Well, we had a pretty miserable entry this month. This is what comes of letting it be known that Gordon Lee and the Editor are available for offers of marriage. We were only joking. Honestly, you can come out now, it's quite safe... come out from under that table at once.

I shall sue. However, I shall put it off till after the prizegiving, which goes like this: best correct answers, S A Siddiqui at Aston, T. Pavelet at Heston, D J Gray at Middletonburgh, P Morgan at Bristol, P Woodson of Wotton-under-Edge, A J Westwood of Ranshampton, E A Newman at (Helen has lost the letter, but we know who

you are, E A J Smith of Teyford, Aastan Henderson of Bromsgrove, and S. Beach of Chichester.

You have also created a special category for Denis O'Malley called 'disqualified because he didn't actually enter the competition'. But the fact of his letter was so good that we had to give him a mention. But seriously, Denis, no tebreaker, OK, but no answer? Clearly your thoughts were on the Tournament of the Island, for which many thanks.

Best tebreaker, for sheer bad taste, was S A Siddiqui "Tis a yellow Dragon round the Old Oak Tree."

All these persons will be receiving a copy of **Base Stealer** from **Orange Software** in due course. Ignore the remark in last month's editorial. The editor was early for once.

Solution

See opposite.

outer space).

For the competition we are returning to our hypothetical (geographical) space). A twelve-inch diameter turn playing record spins at thirty-three and a third revolutions

per minute. The first "radius" groove is about a quarter inch from the outer edge and it ends just here and there inches from the centre of the record, which plays for 23 minutes. Can you devise a sim-

ple program to compute the approximate length of the spiral groove on one side of the record?

The answer should be your assessment of the total length of the spiral.

The Answer

This is Gordon Lee's own solution to the May competition see page 28 for results

TIME square root of 2 (to 125 decimal places) is:

```
1.414213562373095048801698721260169
807692528379167442671858668362486
8042847546060305387116629088367
66181270664780858067240270753647
82657338428475814749497924716
```

(Thus, the final five digits are "92471") (as the next digit in the computation is a 6—a value of "92484" would be acceptable).

This value was computed using a refined method of trials, starting with the value 1414 as the root (and "9999999" as its square). The decimal place was dispensed with during the operation and replaced as the end. Each successive digit was determined by trial, starting with a 0 and decreasing by 1 each time. The required value was the first that was found which took the square to a value with a left hand digit of 1. For example, the square of 14143 is 200024449, but the required final digit of the root is a 2 so we find that 14142 when squared gives 199995964. Therefore, this will determine the correct value. This procedure is continued as often as required in

order to bring the square as close to, but not exceeding, 19999999 (19999999...).

The actual method was performed using string variables in the past in Dragon User. To eliminate the need for the whole calculation to be performed from scratch, a method of computation was devised to allow the revised result to be appended to the previously-computed total. The method used is outlined below, although a full explanation of how it works is too lengthy to be explained here.

- 1) Take the current value of the square and multiply by 100
 - 2) Take its root as previously computed and multiply by 20. Then multiply by the digit being tested.
 - 3) Compute the square of the digit being tested.
 - 4) Add these three values together.
 - 5) This gives the revised square.
- For example, we have found the square 199995964 and its root 14142. We need to find the next digit for the root. So, starting with 0 we repeat the procedure outlined above until the resulting square falls below

19999999 (the number of digits depending on the stage of the calculation. In this case, the digit will be 2).

So, taking each step as above, we get:

- 1) $199995964 \times 100 = 19999596400$ (actually done by putting 00 at the end of the string holding this value).
- 2) $1414 \times 20 \times 2 = 56568$
- 3) 2 squared = 4
- 4) Add these together = 1999965304

This gives the revised square 1999965304 and its root 14142. So the process is repeated until the required degree of accuracy is obtained. As the square will contain twice the number of digits as its root, the maximum length of a string (255 characters) will be adequate for the computation to be made without having to "split" the digits into more than one string.

If the square root value given is tested using the multiplication routine given as listing one on page 28 of the February 1988 DragonUser, it square can be shown to be 19999999 recurring. Altering the final digit (2) to a 4 will produce 20000000 recurring, a value which is too high.

Communication

Write down your problem on the coupon below (make it as brief and legible as possible) together with your name and address and send to: Communication, 40 Alexandra Road, Hounslow, Middlesex TW9 3HP.

Making a line tick

I would like to know if it is possible to draw a line of an certain length at an angle to another line. I would like to be able to draw the second hand of a watch ticking round. The only way I have found of doing this is to use GAB, statements to hold co-ordinates of the lines to be drawn - this is very time consuming as the co-ordinates have to be re-set out on graph paper for each new circle. Is there a better way?

Andrew Lamb
2 Marsham Road
Hazel Grove
Stockport

A little elementary geometry is all that is needed here. Using the SIN and COS functions of Dragon Basic (which work in radians, not degrees), the following program

```
10 MODE 4,1:POL=SCREEN 1,1
20 R=40:XC=(28-YC)*40
30 CIRCLE(XC,YC),R*5
40 FOR S=0 TO 360:INCREMENTS OF A MINUTE
50 X=XC+R*COS(S/57.3),Y=YC+R*SIN(S/57.3)
60 Y=YC+R*SIN(S/57.3),X=XC+R*COS(S/57.3)
70 LINE(XC,YC)-(X,Y),PSET
80 TIMEX=X
90 IF TIME(X) THEN 50
100 LINE(XC,YC)-(X,Y),PSET
110 NEXT S
120 GOTO 40
```

Eprom makes sense?

I bought an eprom programmer from Compuserve and read London: Intercom's review information on how to use a program from memory to eprom, how do I access the program?

Some cartridge games have two sockets with one or two eproms, others only have one. Does it make a difference?

Peter Gurr
17 Marsham Road
Chesham
Essex CM8 3NP

I assumed that you have instructions as to how to actually use the eprom programmer. If not then get them

will draw a second hand centred on the point XC,YC and of length R, ticking round the 60 second positions.

See page 143 of the Dragon Basic manual for an explanation of these functions. I'll leave it to you to add hour and minute hands to the clock!

Sound under machine code

Is it possible to use the SOUND command in machine code? If so, where do I store the note number and duration, and what address do I call?

You use the Dragon's SOUND command from machine code programs, first store the pitch value at location 140 (this is the same as the first number in the Basic SOUND command). The duration should be stored at locations 141/142 as a 16-bit (two byte) number. This should be four times the duration given as the second argument in the Basic SOUND command.

Then immediately call the routine at 47381. This will produce the required sound. The value in 141/142 is incremented in the interrupt routine, so it is important to only set this up immediately before the JSR 47381.

Hi-res in two parts

I am planning to write a graphic adventure game, but I have a few problems. How can you get machine code to split the hi-res screen in two,

the upper half in semi-graphic 24 and the lower half in Priority 4. I've seen this done in The Dark Pit

(The Dark Pit
Simon
W-5475 Cagney
Hornsey)

It is possible to switch modes mid-screen. To do this you need to enable the horizontal sync interrupt by using location 14401, so that an IRQ occurs for every screen line, rather than at the end of each whole screen. Then using a counter to count the IRQs, you can switch modes at a particular scan line.

The drawback is that all these IRQs tend to slow down your main program somewhat. The method is not simple and not for the faint hearted, but it was well explained last year in a *Dragon* *Letter*.

More memory

PL4428 could you answer the following questions which may be of some interest to other readers. Can the Dragon 54 have more memory attached to memory 128K, about as low as cartridge or internal board? Can the Dragon have a second cpu connected and can it be a 58000 or that can run Gam?

David Lindsay
12 Glen Barr
South Molton
Cheshire-in-Shire
Co. Durham
DH2 2UN

THE Dragon's built-in ram (pin-chip) address multiplexed which controls the dynamic ram cannot handle more than 128K itself. However, there is no reason why extra ram should not be added either on board, or in cartridges, which would be back connected with its own control circuitry. However, I do not know of anyone producing add-ons to give access of 128K.

The Dragon cannot have a second cpu connected, and Gam needs a lot more than 128K to work with, anyway.
